

I have a Data Scraping project that uses Selenium and BS4 to scrape the data and upload it to SQL using ODBC Driver in Linux environment running on Python 3.8.3.

I made a container for it using DOcker and installed all the prereq and when I run It locally, it starts scraping the data , uploads it and quits. Works perfectly.

Now I want the container to be run every 20 minutes using Azure Services. How can I achieve what I want in Azure Cloud. thanks

Ill provide some information here, give me commands with the values here thanks
